1. The bile acid dataset for MRMQuant Demonstration

We adopted a dataset extracted from a human aging study to demonstrate the "absolute quantitation using standard curve" experiment type in MRMQuant. The data preparation procedures are provided below. This dataset consisted of 45 testing samples (including five QCs, as listed in Table 1) of 74 bile acids in 53 ion chromatograms (18 of which involved 2–3 isomers). The abbreviated name of the 74 bile acids and other information in the method file is shown in Table 2 and the full name of the 74 bile acids and their corresponding abbreviations is listed in Table 3.

Ultraperformance Liquid Chromatography–Mass Spectrometry (UPLC–MS)

100 μL plasma sample was extracted with 300 μL methanol containing internal standards with liquid-liquid extraction. Sample of mixture was stayed on ice for 30 min and then centrifuged with 12,000 rpm for 30 min at 4 °C for protein precipitation. The supernatant was transferred to sample vial, and analyzed in a LC-MS system (UPLC with Xevo TQ-S MS, Waters, Manchester, UK) with negative electrospray ionization mode with multiple reaction monitoring. The chromatographic separation was achieved on an Acquity BEH C8 reversed-phase column (2.1 × 100-mm i.d., 1.7 μm, Waters Corp., Milford, USA) at 60 °C with mobile phase A (10% acetonitrile with 0.01% formic acid) and mobile phase B (acetonitrile / isopropanol, 1:1, v/v with 0.01% formic acid) and the flow rate was set at 0.6 ml/min. The gradient profile was as follows: keep 10% B for 0.1 min, linear gradient 10–35% B, 9.15 min, 35–85% B, 2.25 min, 85–99% B, 0.5 min, and keep 99% B, 0.5 min. The column was then reequilibrated for 3 min. The parameters of MSMS were as follows: capillary voltage 1.5 kV; desolvation gas flow 1000 L/h; desolvation temperature 600 °C; source temperature 150 °C, and voltage 60 V. System operation and data acquisition were controlled using Mass Lynx software, and targeted metabolic data were analyzed by TargetLynx (Waters, Milford, USA).

TauroBA-sulfate	Tauroursodeoxycholic acid-3-sulfate	BA97
		BA99
rauroda-surrate	l aurochenodeoxycholic acid-3-sulfate	DA99
TauroBA-sulfate TauroBA-sulfate	Taurochenodeoxycholic acid-3-sulfate Taurodeoxycholic acid-3-sulfate	BA100

2. The Phospholipid Dataset for Tool Comparisons

We constructed a dataset consisting of eight technical replicates (as shown in Table 4) of a QC sample extracted from a human aging study to compare the quantitation accuracy of five existing tools (MRMKit, MRMQuant, OpenMS, Skyline, TargetLynx) that are capable of performing MRM data quantitation. The data preparation procedures are provided below. Each replicate contained 184 targeted phospholipids, some of which were isomers that appeared on the same chromatogram. However, as some tools are incapable of handling multiple compounds in an ion chromatogram, only the first compound was retained in each chromatogram, resulting in 163 out of the original 184 phospholipids in the method file, as listed in Table 5. In addition, the boxplots of normalized abundances of the 163 phospholipids among the 8 QC sample replicates of the five tools are presented in Figure 1, whereas the top-20 compounds that exhibited the highest variation across replicates are listed in Table 6. Finally, some examples of problematic quantitations in similar tools are presented in Figure 7.

<u>Ultraperformance Liquid Chromatography–Mass Spectrometry (UPLC–MS)</u>

For lipid extraction, 10 µl of the sample was added to a new microtube. Then, 470 µl of IPA and 20 µl IS solution (Avanti 330709 10 ul; Sigma 605581 5 μg/mL 10ul) and vortexed for 1 minute. The mixture was left at room temperature for 30 min to allow for protein precipitation. The sample was then centrifuged at 12000 ×g for 30 minutes at 4°C, 400 ul of the supernatant was collected, and add 400 ul acetonitrile/water (1:1, v/v). After vortexed for 1 minute, the sample was further diluted by adding 900 µL IPA/ACN/H₂O=2/1/1 mixture with 100 ul sample. The analysis was conducted using Waters ultra-high-performance liquid chromatography coupled with Waters Xevo TQ-S system (Waters, Milford, MA, USA) in positive-ion electrospray ionization (ESI) mode. Chromatographic separation was performed on a Waters ACQUITY BEH C18 column (2.1 mm × 100 mm × 1.7 μm). Column temperature was maintained at 60°C. The mobile phase A was acetonitrile/water (40:60, v/v) with 10 mM ammonium formate, while the mobile phase B was isopropanol/acetonitrile (90:10, v/v) with 10 mM ammonium formate. The flow rate was 0.45 mL/min, and the solvent gradient was as follows: 0-10 min, 40-99% solvent B; 10-10.1 min, 99-40% solvent B; 10.1-12 min, 40% solvent B. The capillary voltage was set at 1000 V for ESI positive ion and 500 V for ESI negative ion. The sampling cone voltage was set at 30 V. The desolvation gas flow rate was set at 1000 L/h, and the cone gas flow was maintained at 150 L/h. The desolvation and source temperatures were set at 500°C and 150°C, respectively. A mixture of all samples, called the Mix QC sample, was prepared and analyzed after every 10th sample during the analytical runs.
